

The DIGITAL plus locomotive decoder LE131 is suitable for all DC motors in HO scale locomotives with continuous current draw of 1.0 Amp. or less. The characteristics of the decoder are:

- * Control of the motor's rotational speed (load compensation). Regardless of the load, the motor's rotation speed is kept nearly constant. During extremely slow movement (for instance through sharp curves and over a series of turnouts), LE131 always provides the motor with enough voltage. This creates the impression that there is actually 100 tons moving.
- * Selectable for operation with 14/27, or 28/55 speed steps.
- * Operation on conventional DC layouts is possible. This feature may be disabled.
- * Provides 1A continuous motor current.
- * Four on/off function outputs with a current rating of 200 mA each. Two of the function outputs are dedicated for the directional headlights.
- * Support for Advanced Consist Control and Extended Addressing
- * Support for short form programming on the main for acceleration and deceleration trim
- * Support for all form of programming as described in NMRA RP-9.2.3
- * Programmable locomotive address, acceleration and brake momentum, speed curve and much more.
- * NMRA RP-9.1.1 medium plug
- * Size: L 1.04" x W 0.67" x H 0.26"
L 26.5 x W 17 x H 6.5 mm

Information LE131

DIGITAL plus

The features of the LE131 Decoder

The LE131 has been revised and is packed with features you expect in a high end decoder. Advanced consist control, extended addressing, outstanding 28 step motor control, and 4 function outputs (two for directional headlight control) are but a few examples. The LE131 supports all forms of programming described in NMRA Recommended Practice 9.2.3, including the user friendly direct CV programming mode. Also, standard is a built in self-test procedure. The advantages of this standardization are obvious: Every locomotive decoder responds in the same way to changes in their properties. All new DIGITAL plus locomotive decoders are produced according to these NMRA DCC standards. This standardization will greatly improve interoperability of locomotive decoders for all manufacturers.

DIGITAL plus decoders built to the NMRA standards and recommended practices are labeled:

This prestigious label means that the NMRA has tested this product and found that it fully complies with all NMRA DCC Standards, Recommended Practices and industry norms.

Many characteristics of the LE131 decoder can be programmed to customize the decoder to its locomotive. For example, you can operate the decoder with the factory pre-set speed table or generate your own. You can set which end of the locomotive is the forward end. You can even decide whether or not you want to be able to operate on conventional DC layouts.

Please read "The Configuration Variables and Their Meanings" section later in this booklet for details on the configuration variables supported by the LE131. There you will find much more information regarding the features and their respective settings.

Back EMF Control

The LE131 uses a form of motor control called "back emf" control. All DC motors produce a small amount of current when they are rotating. The amount of current produced is a function of the load that the motor is controlling. The LE131 measures this current and is able to adjust the current to the motor based upon the motor load. The result is exceptionally fine motor control that is extremely smooth and quiet.

The LE131 employs the finest motor control possible. It is suitable for all forms of motors including coreless motors.

Preparing to Install the LE131

The locomotive must be tested for excellent operation on normal DC power before installing the decoder. Replace worn out motor brushes and burned out light bulbs. Clean any dirt or oxidation from the wheels and pickups, and make sure that electrical contact is smooth. Now is also a good time to lubricate your locomotive. Only a locomotive with impeccable mechanical performance will perform well with the decoder.

Take note which motor brush is connected to the right rail and which to the left rail. This information allows you to connect the decoder to the motor with the correct polarity.

The LE131 is quite small and will fit into most HO locomotives even those with narrow hoods.

Some advice on the current draw of the decoder output:

The current for all the decoder outputs is supplied by an internal rectifier with a maximum current rating of 1.2 Amps. The sum of all currents to the motor and the function outputs cannot exceed this limit. Each individual output can only draw up to it's limit.

Summing up the individual current limits leads to a number larger than 1.2 Amps., but they still are not permitted to draw more than this limit.

Example:

Suppose the motor may require as much as 1.0 A continuously. Then the function outputs combined must not exceed 0.2 A. If the directional headlights require 50 mA each, then the load on function 1 and 2 must not exceed 150 mA.

Some advice on installing the decoder:

Although the LE131 has many internal safeguards to prevent damage, you must not allow any metal part of the locomotive to touch the surface components of the decoder. This could cause a direct internal short circuit and the decoder will be destroyed.

DO NOT WRAP decoder with electricians tape or shrink wrap!

Doing so will impede air circulation and degrade the performance of the decoder. Instead, put electrician tape over any part of the locomotive frame or body that might touch the decoder. This way, you will prevent short circuits without 'suffocating' the decoder.

The shrink wrap over a part of the locomotive decoder protects static sensitive parts and must not be removed. Install the decoder using the provided double sided tape.

Isolate the Motor

The motor brushes **MUST** be isolated from the rail pickup as part of the decoders installation. If the Locomotive comes equipped with an NMRA RP-9.1.1 medium socket, this is accomplished by simply removing the shorting plug from the locomotives installed socket. If the locomotive does not have a socket you might consider installing a decoder with a wiring harness such as the LE130 or install a suitable socket in the locomotive.

If you install a socket, care must be taken to isolate the motor leads from the wheel pickups. Achieving isolation may require some different approaches on different locomotives, perhaps unsoldering wires, placing a thin piece of insulating plastic between brush terminal and contact spring. In other words, after isolation there must be **NO** electrical contact between the motor and the rail pickup. If you have a VOM, check for infinite resistance between the motor and all the wheels. Take special note that metal contact might occur only when the loco body is reinstalled.

The LE131 can not be set up for simultaneous use for 2-rail pickup and overhead cantenary or trolley operation. If the locomotive is turned the wrong way, the decoder could get twice the track voltage which would destroy it!

Wiring Options

The LE131 comes with an NMRA RP-9.1.1 medium plug. This plug includes the wiring for the track, motor, headlights and one extra function. To install it simply remove the dummy socket in your locomotive and install the LE131 plug. To ensure the headlights work properly you must align the plug properly. Pin 1 of the plug (see Figure 1) connects to the orange wire. Ensure this is aligned to pin one of the locomotive. If the plug is installed backwards the lights will not work.

Figure 1: Wiring the LE131 Decoder

Wiring Color Code

There are 8 wires on the plug.

Two pins connect to the track pickups:

- Red wire to right rail pickup (Pin #8).
- Black wire to the left rail pickup (Pin #4).

Two pins connect to the motor terminals:

- Orange wire to the motor terminal which was previously connected to the right rail (Pin #1).

- Gray wire to the motor terminal which was previously connected to the left rail (Pin #5).

Three pins are for the headlights:

- White wire to the forward headlight (Pin #6).
- Yellow wire to the rear headlight (Pin #2).
- blue wire to the headlight positive common (Pin #7).

One pin is for the first extra function:

- Green wire connects to auxiliary function1 (Pin # 3).

Place the locomotive (without the body) on the programming track and read back the locomotive address from the decoder. If the decoder is properly installed, you will be able to read back the factory pre-set address 03. Remove the locomotive from the track, and if necessary correct any wiring errors.

Wiring the Second Auxiliary Function

The LE131 is also able to control a second auxiliary function. This wire is not connected to the plug and must be wired separately.

- Connect the violet wire to the function operated by the '2' key on the Hand Held LH100

The second function common can either be connected to the blue wire or connected to the left hand rail. More current will be available to the extra function if its common is connected to the blue wire. Do not exceed the current rating of 200ma for the extra function.

Place the locomotive (with the body) on the programming track and read back the locomotive address from the decoder. If the decoder is properly installed, you will be able to read back the factory pre-set address 03. Remove the locomotive from the track, and if necessary correct any wiring errors.

Programming the locomotive decoder LE131

Locomotive address, acceleration and brake momentum and all other properties of the decoder can be changed as often as desired. This process is called *programming*.

The properties will be saved in non-volatile memory locations on the locomotive decoder. The values will be permanently saved, even after disconnecting the operating voltage. These memory locations are called "Configuration Variables, or CVs" by the NMRA. The LE131 has a total of 128 CVs. Not all of them are used at this time as many are reserved for future use.

The reading and writing of these values is done electronically, the locomotive does not need to be opened after initial installation of the decoder to read or later modify any CV value.

Any NMRA DCC Command Station, such as the DIGITAL plus LZ100 and a Hand Held LH100 or an Interface LI100, can be used to program the locomotive decoder LE131. With older command stations (including Arnold or Märklin) the decoder supports index mode, a special form of register mode which allows you to easily address all the CVs. Using the Arnold Commander 6, or the ROCO 'DIGITAL is cool' command station, only register 1 (locomotive address) can be set. Many other DCC command stations support paged programming. The LE131 supports this mode as well. Details for reading and writing the decoder's configuration variables can be found in the manuals of the appropriate equipment.

The configuration variables and their meaning

The new line of Lenz advanced decoders, version 5.1, support a full range of features which are set up using a variety of configuration variables. All the configuration variables are numbered. These numbers are used during programming and are identical for all decoders that conform to the NMRA standards independent of the manufacturer. The following table lists the various CVs supported in the LE131 decoder. Both the New CV numbers and the older Register numbers are provided for cross reference.

Please note: Some CVs (such as CV29) have specific meanings for each bit. The bit assignments in this table use a bit numbering scheme of 1-8 to correspond to the 1-8 display on DIGITAL plus systems. Many other systems use a scheme of 0-7 to refer to the individual bits. If you are using such a system you should subtract one from all bit numbers described in these CVs.

Table 1: LE131 Configuration Variables

CV	Register	Description	Range	Factory setting
1	1	Locomotive address: This is the number with which you select a locomotive in the DIGITAL plus system.	1-127	3
2	2	Start voltage: This is the voltage applied to the motor in speed step 1. Set this value so that the locomotive just starts moving in speed step 1.	1-15	1
3	3	Acceleration Momentum: Determines the rate of change of speed upon acceleration. A higher value leads to a slower acceleration.	1-31	1
4	4	Brake Momentum: Determines the rate of change of speed upon braking. A higher value leads to longer brake distance.	1-31	1
5	-	Maximum speed Determines the maximum speed that the locomotive will move. This allows you to operate your locomotives in a prototypical speed range.	1-10	10
-	5	CV29 when the page/pointer register has a value of 1 or value of CV pointed to by Register 6 when register 6 is being used as a pointer register	0-55	4
-	6	Page/Pointer Register: Used during programming for paging or indexing	0-127	1
7	7	Version Number: This location stores the version number of the decoder. This location is read only.	-	51
8	8	Manufacturers Identification: This value is the manufacturer ID of the decoder, (Lenz =99). This location is read only.	-	99
9	-	EMF Frequency Allows you to adjust the pulse rate frequency for finer motor control	0-15	4
17	-	Extended Address High Byte	192-231	0
18	-	Extended Address Low Byte The two byte address if used is contained in CV17+18	0-255	0
19	-	Consist Address The advanced consist address if used is stored in CV19	0-255	0

CV	R	Description	Range	Setting
29	*5	Decoder Configuration, Byte 1: Several decoder properties are set with this byte. Changes are best done in binary mode (see the information for the Hand Held LH100). The detailed properties are:	0-55	4
		bit 1 locomotive direction: 0 = normal: locomotive moves forward when the arrow on the Hand Held points up. 1 = inverted: locomotive moves forward when the arrow on the Hand Held points down.	0,1	0
		bit 2 speed step mode: 0 = Operation with 14 or 27 speed steps. This setting is selected when the locomotive decoder is used with a software below version 2.0, ROCO-Digital, LGB-Digital, Arnold Digital and with all other Digital systems that do not support the 28 speed step mode. 1 = Operation with 28 speed steps. This setting is selected when the locomotive decoder is used with a Command Station with software version 2.0 or higher. The Command Station has to be set to 28 speed step mode for the decoder address, if you are using this setting! Other Digital systems supporting the 28 speed step mode can use the decoder in this setting.	0,1	0
		bit 3 Usage on conventional DC layouts: 0 locomotive operates in digital mode only 1 locomotive can operate in both conventional DC and digital mode.	0,1	1
		bit 4 always 0	0	0
		bit 5 speed curve: 0 factory pre-set speed curve is used 1 user defined speed curve is used. Please enter the appropriate values into CV 67 to 80 before setting this bit.	0,1	0
		bit 6 Extended Addressing 0= Normal addressing 1=Two Byte extended addressing	0-1	0
		bit 7 bit 8 always 0	0	0

CV	R	Description	Range	Setting
30	-	Decoder Error Information		
		bit 1 Motor Short If set short between motor and track	0,1	0
		bit 2 Front Headlight Short If set the front headlight is shorted	0,1	0
		bit 3 Rear Headlight Short If set the rear headlight is shorted	0,1	0
60	-	Decoder Configuration, byte 2: Similar to CV 29, but other properties are set with this byte:		
		bit 1 Back EMF Control If set back emf control is active	0,1	1
		bit 2 Decoder Control Active If set CV30 contains decoder error	0,1	1
		bit 3 Brake momentum on DC operation. This setting is only active with conventional DC operation disabled. (CV 29, bit 3 = 0) This setting can be used to achieve prototypical braking at red signal indications. 0 locomotive proceeds with track voltage dependent speed inside the conventional section. 1 locomotive brakes in the conventional section with pre set brake momentum.	0,1	0
		bit 4-8 not used		
67 to 81	-	Values for user defined speed curve: These registers are used for a user defined speed curve. The factory setting for these registers is 0. If you are trying to use this speed curve unmodified, your locomotive will not move! The value in each register determines the velocity of the locomotive for each assigned speed step: For the 14 speed step mode, speed step 1 is using the value in CV 67, speed step 2 the value in CV 68, speed step 3 the value in CV 69, etc. For the 28 speed step mode, speed step 1 is using the value in CV67, speed step 3 the value in CV 68, speed step 5 the value in CV 69, etc. The intermediate speed steps are calculated by the decoder.	0-63	0

Creating a Speed Curve

Start by writing down how you want to assign the internal speed settings to the speed steps, for example by making up a table as shown below. The table shown is just an example and gives the factory pre-set speed curve for a starting speed of 1.

In the following description, we will assume that the decoder is properly installed and tested, and the locomotive is on the programming track with the power on. We assume you are familiar with the general process of programming using your command station.

Speed step in 14/27 mode	Speed step in 28 mode	Internal speed setting	CV / register
1	1	1	67
2	3	3	68
3	5	5	69
4	7	7	70
5	9	9	71
6	11	12	72
7	13	15	73
8	15	19	74
9	17	23	75
10	19	28	76
11	21	34	77
12	23	42	78
13	25	52	79
14	27	60	80
--	28	63	81

Warranty

Lenz GmbH does everything it can do to ensure that its products are free from defects and will operate for the life of your model railroad equipment. From time to time even the best engineered products fail either due to a faulty part or from accidental mistakes in installation. To protect your investment in Digital Plus products, Lenz GmbH offers a very aggressive 10 year Limited Warranty.

This warranty is not valid if the user has altered, intentionally misused the Digital Plus product, or removed the product's protection, for example the heat shrink

from decoders and other devices. In this case a service charge will be applied for all repairs or replacements. Should the user desire to alter a Digital Plus Product, they should contact Lenz GmbH for prior authorization.

Year One: A full repair or replacement will be provided to the original purchaser for any item that has failed due to manufacturer defects or failures caused by accidental user installation problems. Should the item no longer be produced and the item is not repairable, a similar item will be substituted at the manufacturers discretion. The user must pay for shipping to an authorized Lenz GmbH warranty center.

Year 2 and 3: A full replacement for any item will be provided that has failed due to manufacturer defects. If the failure was caused by accidental user installation or use, a minimal service charge may be imposed. Should the item no longer be produced and the item is not repairable, a similar item will be substituted at the manufacturers discretion. The user must pay shipping to and from the authorized Lenz GmbH warranty center during this portion of the warranty period.

Year 4-10: A minimal service charge will be placed on each item that has failed due to manufacturer defects and/or accidental user installation problems. Should the item no longer be produced and the item is not repairable, a similar item will be substituted at the manufacturers discretion. The user must pay shipping to and from the authorized Lenz GmbH warranty center during this portion of the warranty period.

Please contact your dealer or authorized Lenz GmbH warranty center for specific instructions and current service charges prior to returning any equipment for repair.
