
The connector plate LA150 and the connector LA151 are used for extending the XBUS.

These components allow you to provide connectors for Hand Held units and other input devices for the XBUS at any place on your model railroad.

+LA150 has screw connectors

+LA151 has loose cables

Information
LA150 / 151

Part No. 21150 / 21151

DIGITAL
— plus

Important

Please remember that the cables for the XBUS have to be twisted.

Furthermore, do not put loops or divisions into the XBUS cable. Please read the Information and Manual for the LZ100!

Connector plate LA150

The 5-pole DIN connector is mounted to a small PC board and has screw type terminals. This allows extending the XBUS without the use of a soldering iron.

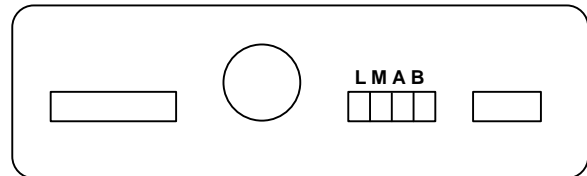

Please connect the terminals on the connector plate with the same terminals on the LZ100.

Connector LA151

This connector is for installation in the front facia of your layout.

The color coding of the cable with respect to the terminals on the LZ100 is as follows:

Color	Terminal
red	L
black	M
white	A
blue	B

XBUS terminals on the LZ100

It is very important that the cables do not get mixed up, since the unit might be damaged.
